????????? i have read various forums Wel, I'm just looking to see if I can figure out a way to get my primary HDD to work, because it's been stuck in "restarting..." for about 5 hours now nothing has worked for me anyone pls help blackbox : as I said: you have no access to another system - in that case ask in ##linux G__81: when you boot the thing, how far do you get to the login screen? __cool__: not at all, why would it? !intel i have not seen any login screen nor i was able to get to the login screen wols: i would have expected it to copy the updates into the mbr if nothing changes, because the bios should set the flag before boot well the time it was stuck i could not even get to the grub menu blackbox : I would suggest you download the iso of your choice, make a bootable usb stick (with unetbootin) and try to install to your notebook __cool__: those are things you have to discuss with your hardware vendor guntbert, i have been trying every way to get it to work but no luck wols: its ubuntu wols: and

it says that i have an intel processor and intel graphics card. there is no option to disable any acpi stuff for my motherboard guntbert, i have tried every usb creator program that ive been able to find and it always ends up a black screen after boot
__cool__: pastebin your Xorg.0.log i was able to get to grub menu when i hit e to edit it my system was stuck G__81: ok, if you got there, what was the output of "dmesg"? nothing happened i could not even see anything G__81: 82157476af
